

# UIG'S COMMUNITY NOTICE BOARD

*Digital signage tailored for the unique requirements of Australian aged care facilities.*

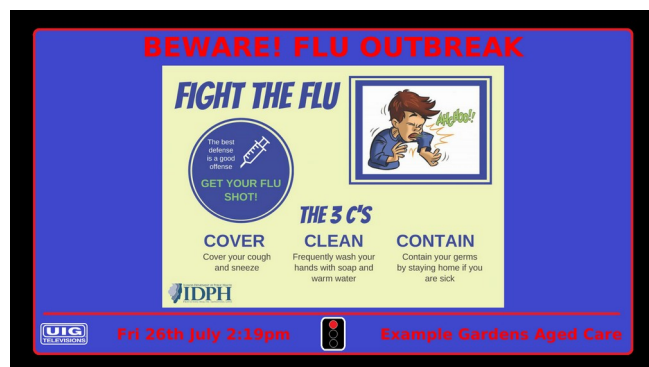

- Comprehensive information & entertainment system for residents, staff and visitors
- Utilises your current existing MATV-connected HD digital TVs regardless of type
- Supports text, images, animated images, video, web streams & movies to multiple zones
- Content can be delivered site-wide or to specific areas from the admin web-interface
- Unique traffic light current site safety indicator provides peace-of-mind to all
- Scheduled 28 day rotating catering menu with override options
- World news headlines, localised weather forecasts and UV exposure warnings
- Stream selected radio stations for background music
- Multiple priority levels green, yellow and red for traffic light site-safety status
- Emergency mode via links to external equipment to aid emergency responses
- Highly reliable as equipment resides on-site and internet access is not essential
- No requirement to modify or upgrade existing IT setup
- Aids in proof of accreditation compliance currently to 65 criteria
- Optional free and legal web-streams plus royalty-free movie collection
- Flat-rate pricing regardless of how many TVs on-site

UIG's 'Community Notice Board' digital signage system has been developed as a result of extensive industry consultation. Ease of use, proof of compliance, reliability, installation simplicity and cost effectiveness have been the driving principles. Flexibility is guaranteed as multimedia output can be broadcast throughout an entire site or targeted at specific areas (zones). This allows any aged care facility operator to provide mandated information, catering, local news and events, warnings, weather forecast (including dangerous UV exposure times) and optional entertainment via web-streams or on-site movie libraries to any or all locations when required all from a single, easy to use web interface.

Whilst system output can be directed to any number of endpoints (phones, tablets, watches, kiosks, panels, projectors etc) the most cost effective method is to inject the digital signal into the facility's MATV antenna system and utilise the existing HD digital TVs (regardless of type). This way, output can be generated throughout a facility without having to install distribution cables, displays or any other associated equipment.

Facilities can now provide relevant information in an easy to read format whereby text, images, animated images, video, web-streams and movies can all be used to educate, inform, entertain and warn residents, staff, visitors and contractors in a non-obtrusive, calm manner. General information slides, food menu slides, compliance related slides (evacuation points or complaints handling procedures as an example), activities slides, news/weather (with UV warnings) slides, quiz slides and warning and alert slides can all be invoked as required and set to a roster if required. Facilities also have the choice of streaming various radio stations though the system if they wish. Via the use of UIG's unique traffic light safety indicator, all people within the facility can quickly see and determine whether 'everything is OK', or, 'there is something I should take notice of', or, 'there is something I definitely need to know about'. This way, residents, staff and visitors will always be informed of the information they need to know whilst operators will be able to prove what was communicated and when.

For further information, technical assistance and pricing please contact UIG via the details below.
